

Forest Carbon Report: Louisiana

<u>Carbon pool</u>: a component of the forest that can gain or lose carbon over time

<u>Carbon storage</u>: the amount of carbon retained in a forest and/or carbon pool

<u>Carbon sequestration</u>: the process by which trees and plants use carbon dioxide and photosynthesis to store carbon as biomass

<u>Units</u>: Forest carbon is typically expressed in US tons per acre or metric tons (1 metric ton = 1.10 US tons)

Quick Facts on Forest Carbon

- Louisiana has 15.0 million acres of forests and is 54% forested.
- Louisiana forest carbon stocks have increased by 10% from 1990 to 2019.
- Average carbon density in aboveground trees across Louisiana forests is 23.2 US tons per acre.
- In Louisiana, forests, urban trees, and harvested wood products:
 - Remove 8% of all CO₂ emissions in the state. (Across the US, this value is 14%.)
 - Store the equivalent of 15 years of all CO₂ emissions produced in the state.
