Carbon Definitions

Carbon pool: a component of the forest that can gain or lose carbon over time

Carbon storage: the amount of carbon retained in a forest and/or carbon pool

Carbon sequestration: the process by which trees and plants use carbon dioxide and photosynthesis to store carbon as biomass

Units: Forest carbon is typically expressed in US tons per acre or metric tons (1 metric ton = 1.10 US tons)

Quick Facts on Forest Carbon

- Wisconsin has 17.1 million acres of forests and is 49% forested.
- Wisconsin forest carbon stocks have increased by 11% from 1990 to 2019.
- Average carbon density in aboveground trees across Wisconsin forests is 20.7 US tons per acre.
- In Wisconsin, forests, urban trees, and harvested wood products:
 - Remove 15% of all CO₂ emissions in the state. (Across the US, this value is 14%.)
 - Store the equivalent of 43 years of all CO₂ emissions produced in the state.
